

ERROR LOG

Step 10. LaTeX Errors / Problems

Prism gave no compilation error during the project. The following table is a list of common LaTeX errors/problems and their typical causes and fixes; these were not errors reported by Prism.

Error / Problem	Likely Cause	Prism Suggestion	Final Correction
Undefined control sequence	Command used without required package.	Identify the command and package.	Add the required package in the preamble, e.g. <code>graphicx</code> , <code>amsmath</code> , or <code>booktabs</code> .
Undefined reference	<code>\ref</code> points to a missing or incorrectly named <code>\label</code> .	Check matching label and recompile.	Add/correct the <code>\label</code> and compile again.
Missing <code>}</code> inserted / runaway argument	Missing or incorrectly nested closing brace.	Locate unmatched braces.	Add the missing closing brace and check command structure.
Figure not found	Filename/path in <code>\includegraphics</code> does not match the figure file.	Check filename, extension and project path.	Correct filename/path or place the figure in the <code>Figures/</code> directory.
